

5-6. Suppose A , B , and C are the three cartesian coordinates of momentum p_x , p_y , p_z . What is the form of function the $\chi_{a,b,c}(x, y, z)$?

From equation (5.6)

$$\phi(\mathbf{p}) = \int_{\mathbb{R}^3} \exp\left(-\frac{i\mathbf{p} \cdot \mathbf{x}}{\hbar}\right) f(\mathbf{x}) dx dy dz$$

From equation (5.36)

$$F_{a,b,c} = \int_{\mathbb{R}^3} \chi_{a,b,c}^*(\mathbf{x}) f(\mathbf{x}) dx dy dz$$

Noting that $\phi(\mathbf{p}) = F_{a,b,c}$ for $\mathbf{p} = (a, b, c)$ we have

$$\chi_{a,b,c}^*(\mathbf{x}) = \exp\left(-\frac{i(a, b, c) \cdot \mathbf{x}}{\hbar}\right)$$

and

$$\chi_{a,b,c}(\mathbf{x}) = \exp\left(\frac{i(a, b, c) \cdot \mathbf{x}}{\hbar}\right)$$
