

Rotating wave approximation

Let $\Psi(\mathbf{r}, t)$ be the following wave function for a two state system.

$$\Psi(\mathbf{r}, t) = c_a(t)\psi_a(\mathbf{r}) \exp\left(-\frac{i}{\hbar}E_a t\right) + c_b(t)\psi_b(\mathbf{r}) \exp\left(-\frac{i}{\hbar}E_b t\right)$$

Let $\hat{H}(\mathbf{r}, t)$ be the Hamiltonian

$$\hat{H}(\mathbf{r}, t) = \hat{H}_0(\mathbf{r}) + \hat{H}_1(\mathbf{r}, t)$$

where

$$\hat{H}_0\psi_a = E_a\psi_a, \quad \hat{H}_0\psi_b = E_b\psi_b$$

From the Schrödinger equation

$$i\hbar\frac{\partial}{\partial t}\Psi = \hat{H}\Psi$$

we obtain the differential equations

$$\begin{aligned} \frac{d}{dt}c_a(t) &= -\frac{i}{\hbar}c_a(t)\langle\psi_a|\hat{H}_1|\psi_a\rangle - \frac{i}{\hbar}c_b(t)\langle\psi_a|\hat{H}_1|\psi_b\rangle \exp(-i\omega_0 t) \\ \frac{d}{dt}c_b(t) &= -\frac{i}{\hbar}c_b(t)\langle\psi_b|\hat{H}_1|\psi_b\rangle - \frac{i}{\hbar}c_a(t)\langle\psi_b|\hat{H}_1|\psi_a\rangle \exp(i\omega_0 t) \end{aligned}$$

where

$$\omega_0 = \frac{E_b - E_a}{\hbar}$$

Typically the diagonal elements vanish as

$$\langle\psi_a|\hat{H}_1|\psi_a\rangle = \langle\psi_b|\hat{H}_1|\psi_b\rangle = 0$$

and the differential equations become

$$\frac{d}{dt}c_a(t) = -\frac{i}{\hbar}c_b(t)\langle\psi_a|\hat{H}_1|\psi_b\rangle \exp(-i\omega_0 t) \tag{1}$$

$$\frac{d}{dt}c_b(t) = -\frac{i}{\hbar}c_a(t)\langle\psi_b|\hat{H}_1|\psi_a\rangle \exp(i\omega_0 t) \tag{2}$$

Let $\hat{H}_1(\mathbf{r}, t)$ be the perturbation

$$\hat{H}_1(\mathbf{r}, t) = \hat{V}(\mathbf{r}) \cos(\omega t)$$

Then

$$\langle\psi_a|\hat{H}_1|\psi_b\rangle = \langle\psi_a|\hat{V}|\psi_b\rangle \left(\frac{1}{2}\exp(i\omega t) + \frac{1}{2}\exp(-i\omega t)\right)$$

The rotating wave approximation discards the second term and asserts

$$\langle\psi_a|\hat{H}_1|\psi_b\rangle = \frac{1}{2}\langle\psi_a|\hat{V}|\psi_b\rangle \exp(i\omega t) \tag{3}$$

Substitute equation (3) into (1) and (2) to obtain

$$\frac{d}{dt}c_a(t) = -\frac{i}{2\hbar}c_b(t)\langle\psi_a|\hat{V}|\psi_b\rangle\exp(i(\omega-\omega_0)t) \quad (4)$$

$$\frac{d}{dt}c_b(t) = -\frac{i}{2\hbar}c_a(t)\langle\psi_b|\hat{V}|\psi_a\rangle\exp(i(\omega_0-\omega)t) \quad (5)$$

Use Laplace transforms to solve for $c_b(t)$ with initial conditions $c_a(0) = 1$ and $c_b(0) = 0$.

$$c_b(t) = -\frac{i}{\hbar}\langle\psi_b|\hat{V}|\psi_a\rangle\frac{\sin(\omega_r t)}{2\omega_r}\exp\left(\frac{i}{2}(\omega_0-\omega)t\right) \quad (6)$$

Symbol ω_r is the Rabi flopping frequency

$$\omega_r = \frac{1}{2}\sqrt{(\omega_0-\omega)^2 + |\langle\psi_a|\hat{V}|\psi_b\rangle|^2/\hbar^2}$$

Use equation (2) and the solution for $c_b(t)$ to solve for $c_a(t)$.

$$c_a(t) = \left[\cos(\omega_r t) + i\left(\frac{\omega_0-\omega}{2\omega_r}\right)\sin(\omega_r t)\right]\exp\left(-\frac{i}{2}(\omega_0-\omega)t\right)$$

Rewrite ω_r as

$$\omega_r = \frac{1}{2\hbar}\sqrt{\hbar^2(\omega_0-\omega)^2 + |\langle\psi_a|\hat{V}|\psi_b\rangle|^2}$$

and note that for

$$\hbar^2(\omega_0-\omega)^2 \gg |\langle\psi_a|\hat{V}|\psi_b\rangle|^2$$

we have

$$\omega_r \approx \frac{1}{2}|\omega_0-\omega| \quad (7)$$

Substitute (7) into (6) to obtain

$$c_b(t) = -\frac{i}{\hbar}\langle\psi_b|\hat{V}|\psi_a\rangle\frac{\sin\left(\frac{1}{2}|\omega_0-\omega|t\right)}{|\omega_0-\omega|}\exp\left(\frac{i}{2}(\omega_0-\omega)t\right)$$

This is equivalent to $c_b(t)$ obtained from first order perturbation expansion.
