

Exercise 6.1. Prove that if $P(a, b)$ factorizes, then the correlation between a and b is zero.

We have

$$\langle a \rangle \langle b \rangle = \left(\sum_a a P(a) \right) \left(\sum_b b P(b) \right) = \sum_a \sum_b ab P(a) P(b) \quad (1)$$

Let $P(a, b) = P(a)P(b)$. Then

$$\sum_a \sum_b ab P(a) P(b) = \sum_a \sum_b ab P(a, b) = \langle ab \rangle \quad (2)$$

By (1) and (2) we have

$$\langle a \rangle \langle b \rangle = \langle ab \rangle$$

Hence a and b are uncorrelated.

Note that $P(a, b) = P(a)P(b)$ is the definition of independence. Hence a and b are uncorrelated by independence.
