## Dirac spinors

Let  $\phi$  be the field

$$\phi = p_x x + p_y y + p_z z - Et$$

where

$$E = \sqrt{p_x^2 c^2 + p_y^2 c^2 + p_z^2 c^2 + m^2 c^4}$$

Fermion fields are the following solutions to the Dirac equation.

$$\psi_{1} = \begin{pmatrix} E/c + mc \\ 0 \\ p_{z} \\ p_{x} + ip_{y} \end{pmatrix} \exp\left(\frac{i\phi}{\hbar}\right) \qquad \qquad \psi_{2} = \begin{pmatrix} 0 \\ E/c + mc \\ p_{x} - ip_{y} \\ -p_{z} \end{pmatrix} \exp\left(\frac{i\phi}{\hbar}\right)$$
fermion spin up
$$\psi_{1} = \begin{pmatrix} 0 \\ E/c + mc \\ p_{x} - ip_{y} \\ -p_{z} \end{pmatrix} \exp\left(\frac{i\phi}{\hbar}\right)$$

$$\psi_7 = \begin{pmatrix} p_z \\ p_x + ip_y \\ E/c + mc \\ 0 \end{pmatrix} \exp\left(-\frac{i\phi}{\hbar}\right) \qquad \psi_8 = \begin{pmatrix} p_x - ip_y \\ -p_z \\ 0 \\ E/c + mc \end{pmatrix} \exp\left(-\frac{i\phi}{\hbar}\right)$$
anti-fermion spin up
$$\frac{i\phi}{\hbar} = \begin{pmatrix} p_x - ip_y \\ -p_z \\ 0 \\ E/c + mc \end{pmatrix}$$
anti-fermion spin down

A spinor is the vector part of  $\psi$ .

$$u_{1} = \begin{pmatrix} E/c + mc \\ 0 \\ p_{z} \\ p_{x} + ip_{y} \end{pmatrix}$$

$$u_{2} = \begin{pmatrix} 0 \\ E/c + mc \\ p_{x} - ip_{y} \\ -p_{z} \end{pmatrix}$$
fermion spin up
fermion spin down

$$v_1 = \begin{pmatrix} p_z \\ p_x + ip_y \\ E/c + mc \\ 0 \end{pmatrix}$$
  $v_2 = \begin{pmatrix} p_x - ip_y \\ -p_z \\ 0 \\ E/c + mc \end{pmatrix}$  anti-fermion spin up

This is the spacetime momentum vector p.

$$p = \begin{pmatrix} E/c \\ p_x \\ p_y \\ p_z \end{pmatrix}$$

Spinors are solutions to the momentum-space Dirac equations

$$pu = mcu, \quad pv = -mcv$$

where

$$p = p^{\mu} g_{\mu\nu} \gamma^{\nu}$$

Up and down spinors have the following completeness property.

$$u_1\bar{u}_1 + u_2\bar{u}_2 = (E/c + mc)(\not p + mc)$$
  
 $v_1\bar{v}_1 + v_2\bar{v}_2 = (E/c + mc)(\not p - mc)$ 

Spinor adjoints are

$$\bar{u} = u^{\dagger} \gamma^0, \quad \bar{v} = v^{\dagger} \gamma^0$$

hence  $u\bar{u}$  and  $v\bar{v}$  are outer products that form  $4\times 4$  matrices.
