Integral

integral(f,x) returns the integral of f with respect to x.

```
integral(x^2, x)
\frac{1}{2}x^3
```

Extend the argument list for multiple integrals.

```
f = x y
integral(f,x,y)
\frac{1}{4}x^2y^2
```

defint(f,x,a,b) computes the definite integral of f with respect to x evaluated from a to b. The argument list can be extended for multiple integrals. The following example computes the integral of $f = x^2$ over the domain of a semicircle. For each x along the abscissa, y ranges from 0 to $\sqrt{1-x^2}$.

```
defint(x^2, y, 0, sqrt(1 - x^2), x, -1, 1) \frac{1}{8}\pi
```

Alternatively, eval can be used to compute a definite integral step by step.

Here is a useful trick. Integrals involving sine and cosine can often be solved using exponentials. For example, the definite integral

$$\int_0^{2\pi} (\sin^4 t - 2\cos^3(t/2)\sin t) dt$$

can be solved as follows.

```
f = \sin(t)^4 - 2 \cos(t/2)^3 \sin(t)
f = \operatorname{circexp}(f)
defint(f, t, 0, 2 pi)
\frac{3}{4}\pi - \frac{16}{5}
```
