Exercise 6.7. Next, Charlie prepares the spins in a different state, called $|T_1\rangle$, where

$$|T_1\rangle = \frac{1}{\sqrt{2}} \left(|ud\rangle + |du\rangle \right)$$

In these examples, T stands for *triplet*. These triplet states are completely different from the states in the coin and die examples. What are the expectation values of the operators $\sigma_z \tau_z$, $\sigma_x \tau_x$, and $\sigma_y \tau_y$?

What a difference a sign can make!

See Eigenmath code.

$$\langle \sigma_z \tau_z \rangle = \langle T_1 | \sigma_z \tau_z | T_1 \rangle = -1$$

 $\langle \sigma_x \tau_x \rangle = \langle T_1 | \sigma_x \tau_x | T_1 \rangle = 1$

$$\langle \sigma_y \tau_y \rangle = \langle T_1 | \sigma_y \tau_y | T_1 \rangle = 1$$
