Annihilation

Annihilation is the process $e^- + e^+ \rightarrow \gamma + \gamma$.

The following center-of-mass momentum vectors have $E = \sqrt{p^2 + m^2}$.

$$p_{1} = \begin{pmatrix} E \\ 0 \\ 0 \\ p \end{pmatrix} \qquad p_{2} = \begin{pmatrix} E \\ 0 \\ 0 \\ -p \end{pmatrix} \qquad p_{3} = \begin{pmatrix} E \\ E \sin \theta \cos \phi \\ E \sin \theta \sin \phi \\ E \cos \theta \end{pmatrix} \qquad p_{4} = \begin{pmatrix} E \\ -E \sin \theta \cos \phi \\ -E \sin \theta \sin \phi \\ -E \cos \theta \end{pmatrix}$$

Spinors for p_1 .

$$u_{11} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} E+m\\0\\p\\0 \end{pmatrix} \qquad u_{12} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0\\E+m\\0\\-p \end{pmatrix}$$
spin up

Spinors for p_2 .

$$v_{21} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} -p\\0\\E+m\\0 \end{pmatrix} \qquad v_{22} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0\\p\\0\\E+m \end{pmatrix}$$
spin down

The scattering amplitude $\mathcal{M}_{ab}^{\mu\nu}$ for spin ab and polarization $\mu\nu$ is

$$\mathcal{M}_{ab}^{\mu
u} = \mathcal{M}_{1ab}^{\mu
u} + \mathcal{M}_{2ab}^{
u\mu}$$

where

$$\mathcal{M}_{1ab}^{\mu\nu} = \frac{\bar{v}_{2b}(-ie\gamma^{\mu})(\not q_1 + m)(-ie\gamma^{\nu})u_{1a}}{t - m^2}$$
$$\mathcal{M}_{2ab}^{\nu\mu} = \frac{\bar{v}_{2b}(-ie\gamma^{\nu})(\not q_2 + m)(-ie\gamma^{\mu})u_{1a}}{u - m^2}$$

Matrices $\not q_1$ and $\not q_2$ represent momentum transfer.

Scalars t and u are Mandelstam variables.

$$t = (p_1 - p_3)^2$$
$$u = (p_1 - p_4)^2$$

In component form

$$\mathcal{M}_{1ab}^{\mu\nu} = \frac{(\bar{v}_{2b})_{\alpha}(-ie\gamma^{\mu\alpha}{}_{\beta})(\not q_1 + m)^{\beta}{}_{\rho}(-ie\gamma^{\nu\rho}{}_{\sigma})(u_{1a})^{\sigma}}{t - m^2}$$

$$\mathcal{M}_{2ab}^{\nu\mu} = \frac{(\bar{v}_{2b})_{\alpha}(-ie\gamma^{\nu\alpha}{}_{\beta})(\not q_2 + m)^{\beta}{}_{\rho}(-ie\gamma^{\mu\rho}{}_{\sigma})(u_{1a})^{\sigma}}{u - m^2}$$

Expected probability density $\langle |\mathcal{M}|^2 \rangle$ is the sum over squared amplitudes divided by the number of inbound states.

$$\langle |\mathcal{M}|^2 \rangle = \frac{1}{4} \sum_{ab} \sum_{\mu\nu} \left| \mathcal{M}_{ab}^{\mu\nu} \right|^2$$

Summing over $\mu\nu$ requires $g_{\mu\nu}$ to lower indices.

$$\langle |\mathcal{M}|^2 \rangle = \frac{1}{4} \sum_{ab} \mathcal{M}_{ab}^{\mu\nu} \left(g_{\mu\alpha} \mathcal{M}_{ab}^{\alpha\beta} g_{\beta\nu} \right)^*$$

Expand the summand and label the terms. By positivity $\boxed{2} = \boxed{3}$.

$$\langle |\mathcal{M}|^{2} \rangle = \frac{1}{4} \sum_{ab} \left[\mathcal{M}_{1ab}^{\mu\nu} \left(g_{\mu\alpha} \mathcal{M}_{1ab}^{\alpha\beta} g_{\beta\nu} \right)^{*} + \mathcal{M}_{1ab}^{\mu\nu} \left(g_{\nu\alpha} \mathcal{M}_{2ab}^{\alpha\beta} g_{\beta\mu} \right)^{*} \right.$$

$$\left. + \mathcal{M}_{2ab}^{\nu\mu} \left(g_{\mu\alpha} \mathcal{M}_{1ab}^{\alpha\beta} g_{\beta\nu} \right)^{*} + \mathcal{M}_{2ab}^{\nu\mu} \left(g_{\nu\alpha} \mathcal{M}_{2ab}^{\alpha\beta} g_{\beta\mu} \right)^{*} \right]$$

$$\left. \left. \right]$$

The following Casimir trick uses matrix arithmetic to sum over spin and polarization states.

$$\begin{split} &\sum_{ab} \boxed{1} = \frac{e^4}{(t-m^2)^2} \operatorname{Tr} \left[(\not p_1 + m) \gamma^\mu (\not q_1 + m) \gamma^\nu (\not p_2 - m) \gamma_\nu (\not q_1 + m) \gamma_\mu \right] \\ &\sum_{ab} \boxed{2} = \frac{e^4}{(t-m^2)(u-m^2)} \operatorname{Tr} \left[(\not p_1 + m) \gamma^\mu (\not q_2 + m) \gamma^\nu (\not p_2 - m) \gamma_\mu (\not q_1 + m) \gamma_\nu \right] \\ &\sum_{ab} \boxed{4} = \frac{e^4}{(u-m^2)^2} \operatorname{Tr} \left[(\not p_1 + m) \gamma^\mu (\not q_2 + m) \gamma^\nu (\not p_2 - m) \gamma_\nu (\not q_2 + m) \gamma_\mu \right] \end{split}$$

Probability density $\langle |\mathcal{M}|^2 \rangle$ can be reformulated as

$$\langle |\mathcal{M}|^2 \rangle = \frac{e^4}{4} \left[\frac{f_{11}}{(t-m^2)^2} + \frac{2f_{12}}{(t-m^2)(u-m^2)} + \frac{f_{22}}{(u-m^2)^2} \right]$$

with Casimir trick terms

$$f_{11} = \operatorname{Tr}\left[(\not p_1 + m)\gamma^{\mu} (\not q_1 + m)\gamma^{\nu} (\not p_2 - m)\gamma_{\nu} (\not q_1 + m)\gamma_{\mu} \right]$$

$$f_{12} = \operatorname{Tr}\left[(\not p_1 + m)\gamma^{\mu} (\not q_2 + m)\gamma^{\nu} (\not p_2 - m)\gamma_{\mu} (\not q_1 + m)\gamma_{\nu} \right]$$

$$f_{22} = \operatorname{Tr}\left[(\not p_1 + m)\gamma^{\mu} (\not q_2 + m)\gamma^{\nu} (\not p_2 - m)\gamma_{\nu} (\not q_2 + m)\gamma_{\mu} \right]$$

The following formulas are equivalent to the Casimir trick. (Recall that $a \cdot b = a^{\mu}g_{\mu\nu}b^{\nu}$)

$$f_{11} = 32(p_1 \cdot p_3)(p_1 \cdot p_4) + 32(p_1 \cdot p_3)m^2 - 32m^4$$

$$f_{12} = 16(p_1 \cdot p_2)m^2 - 16m^4$$

$$f_{22} = 32(p_1 \cdot p_3)(p_1 \cdot p_4) + 32(p_1 \cdot p_4)m^2 - 32m^4$$

In Mandelstam variables

$$f_{11} = 8tu - 24tm^2 - 8um^2 - 8m^4$$

$$f_{12} = 8sm^2 - 32m^4$$

$$f_{22} = 8tu - 8tm^2 - 24um^2 - 8m^4$$

For $E \gg m$ a useful approximation is to set m=0 and obtain

$$f_{11} = 8tu$$
$$f_{12} = 0$$
$$f_{22} = 8tu$$

Hence

$$\langle |\mathcal{M}|^2 \rangle = \frac{e^4}{4} \left(\frac{f_{11}}{(t - m^2)^2} + \frac{2f_{12}}{(t - m^2)(u - m^2)} + \frac{f_{22}}{(u - m^2)^2} \right)$$
$$= \frac{e^4}{4} \left(\frac{8tu}{t^2} + \frac{8tu}{u^2} \right)$$
$$= 2e^4 \left(\frac{u}{t} + \frac{t}{u} \right)$$

For m = 0 the Mandelstam variables are

$$t = -2E^{2}(1 - \cos \theta)$$
$$u = -2E^{2}(1 + \cos \theta)$$

Hence

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{1 + \cos \theta}{1 - \cos \theta} + \frac{1 - \cos \theta}{1 + \cos \theta} \right)$$

Cross section

The differential cross section is

$$\frac{d\sigma}{d\Omega} = \frac{\langle |\mathcal{M}|^2 \rangle}{4(4\pi\varepsilon_0)^2 s}$$

where

$$s = (p_1 + p_2)^2 = 4E^2$$

For high energy experiments we have

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{1 + \cos \theta}{1 - \cos \theta} + \frac{1 - \cos \theta}{1 + \cos \theta} \right)$$

Hence

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{2(4\pi\varepsilon_0)^2 s} \left(\frac{1+\cos\theta}{1-\cos\theta} + \frac{1-\cos\theta}{1+\cos\theta} \right)$$

Noting that

$$e^2 = 4\pi\varepsilon_0 \alpha \hbar c$$

we have

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2 (\hbar c)^2}{2s} \left(\frac{1 + \cos \theta}{1 - \cos \theta} + \frac{1 - \cos \theta}{1 + \cos \theta} \right)$$

Noting that

$$d\Omega = \sin\theta \, d\theta \, d\phi$$

we also have

$$d\sigma = \frac{\alpha^2(\hbar c)^2}{2s} \left(\frac{1 + \cos \theta}{1 - \cos \theta} + \frac{1 - \cos \theta}{1 + \cos \theta} \right) \sin \theta \, d\theta \, d\phi$$

Let $S(\theta_1, \theta_2)$ be the following integral of $d\sigma$.

$$S(\theta_1, \theta_2) = \int_0^{2\pi} \int_{\theta_1}^{\theta_2} d\sigma$$

The solution is

$$S(\theta_1, \theta_2) = \frac{\pi \alpha^2 (\hbar c)^2}{s} [I(\theta_2) - I(\theta_1)]$$

where

$$I(\theta) = 2\cos\theta + 2\log(1-\cos\theta) - 2\log(1+\cos\theta)$$

The cumulative distribution function is

$$F(\theta) = \frac{S(a, \theta)}{S(a, \pi - a)} = \frac{I(\theta) - I(a)}{I(\pi - a) - I(a)}, \quad a \le \theta \le \pi - a$$

Angular support is reduced by an arbitrary angle a > 0 because I(0) and $I(\pi)$ are undefined.

The probability of observing scattering events in the interval θ_1 to θ_2 is

$$P(\theta_1 < \theta \le \theta_2) = F(\theta_2) - F(\theta_1)$$

The probability density function is

$$f(\theta) = \frac{dF(\theta)}{d\theta} = \frac{1}{I(\pi - a) - I(a)} \left(\frac{1 + \cos \theta}{1 - \cos \theta} + \frac{1 - \cos \theta}{1 + \cos \theta} \right) \sin \theta$$
