8-3. Show that Q_{α}^c , Q_{α}^s are normal coordinates corresponding to standing wave normal modes $\cos(2\pi\alpha j/N)$ and $\sin(2\pi\alpha j/N)$, in the sense that (for N odd)

$$q_{j}(t) = \sqrt{\frac{2}{N}} \left(\frac{1}{2} Q_{0}^{c}(t) + \sum_{\alpha=1}^{(N-1)/2} \left(Q_{\alpha}^{c}(t) \cos \frac{2\pi\alpha j}{N} + Q_{\alpha}^{s}(t) \sin \frac{2\pi\alpha j}{N} \right) \right)$$
(8.82)

(Note: A typo in 8.82 is fixed.)

Consider the following equations.

$$Q_{\alpha}(t) = \frac{1}{\sqrt{N}} \sum_{k=1}^{N} q_k(t) \left(\cos \frac{2\pi\alpha k}{N} - i \sin \frac{2\pi\alpha k}{N} \right)$$
 (8.77)

$$Q_{\alpha}^{c} = \frac{1}{\sqrt{2}}(Q_{\alpha} + Q_{\alpha}^{*}) \tag{8.79}$$

$$Q_{\alpha}^{s} = \frac{i}{\sqrt{2}}(Q_{\alpha} - Q_{\alpha}^{*}) \tag{8.80}$$

Rewrite (8.82) as

$$q_j = \frac{1}{\sqrt{2N}} Q_0^c + \frac{1}{N} \sum_{c=1}^{(N-1)/2} \sum_{k=1}^N q_k (T_1 + T_2 + T_3 - T_4)$$
 (1)

where

$$T_{1} = \cos \frac{2\pi\alpha k}{N} \cos \frac{2\pi\alpha j}{N} - i \sin \frac{2\pi\alpha k}{N} \cos \frac{2\pi\alpha j}{N}$$

$$T_{2} = \cos \frac{2\pi\alpha k}{N} \cos \frac{2\pi\alpha j}{N} + i \sin \frac{2\pi\alpha k}{N} \cos \frac{2\pi\alpha j}{N}$$

$$T_{3} = i \cos \frac{2\pi\alpha k}{N} \sin \frac{2\pi\alpha j}{N} + \sin \frac{2\pi\alpha k}{N} \sin \frac{2\pi\alpha j}{N}$$

$$T_{4} = i \cos \frac{2\pi\alpha k}{N} \sin \frac{2\pi\alpha j}{N} - \sin \frac{2\pi\alpha k}{N} \sin \frac{2\pi\alpha j}{N}$$

It follows that

$$T_1 + T_2 + T_3 - T_4 = 2\cos\frac{2\pi\alpha k}{N}\cos\frac{2\pi\alpha j}{N} + 2\sin\frac{2\pi\alpha k}{N}\sin\frac{2\pi\alpha j}{N}$$

By trigonometric identities

$$T_1 + T_2 + T_3 - T_4 = 2\cos\left(\frac{2\pi\alpha}{N}(j-k)\right)$$
 (2)

Substitute (2) into (1) to obtain

$$q_{j} = \frac{1}{\sqrt{2N}}Q_{0}^{c} + \frac{2}{N}\sum_{\alpha=1}^{(N-1)/2}\sum_{k=1}^{N}q_{k}\cos\left(\frac{2\pi\alpha}{N}(j-k)\right)$$

Note that

$$Q_0^c = \sqrt{\frac{2}{N}} \sum_{k=1}^N q_k$$

Hence

$$q_{j} = \frac{1}{N} \sum_{k=1}^{N} q_{k} + \frac{2}{N} \sum_{\alpha=1}^{(N-1)/2} \sum_{k=1}^{N} q_{k} \cos\left(\frac{2\pi\alpha}{N}(j-k)\right)$$

Rewrite as

$$q_{j} = \frac{1}{N} \sum_{k=1}^{N} q_{k} \left(1 + 2 \sum_{\alpha=1}^{(N-1)/2} \cos \left(\frac{2\pi\alpha}{N} (j-k) \right) \right)$$
 (3)

For the sum over α we have

$$\sum_{\alpha=1}^{(N-1)/2} \cos\left(\frac{2\pi\alpha}{N}(j-k)\right) = \begin{cases} (N-1)/2 & j=k\\ -1/2 & j\neq k \end{cases}$$

Hence for j = k

$$1 + 2\sum_{\alpha=1}^{(N-1)/2} \cos\left(\frac{2\pi\alpha}{N}(j-k)\right) = N$$

and for $j \neq k$

$$1 + 2 \sum_{\alpha=1}^{(N-1)/2} \cos\left(\frac{2\pi\alpha}{N}(j-k)\right) = 0$$

Therefore (3) is shown to be true.
