### Feature index

#### abs(x)

Returns the absolute value or vector length of x.

```
X = (x,y,z)
abs(X)
(x^2 + y^2 + z^2)^{1/2}
```

## adj(m)

Returns the adjunct of matrix m. Adjunct is equal to determinant times inverse.

```
A = ((a,b),(c,d))
adj(A) == det(A) inv(A)
```

## $and(a, b, \ldots)$

Returns 1 if all arguments are true (nonzero). Returns 0 otherwise.

```
and(1=1,2=2)
```

1

1

## arccos(x)

Returns the arc cosine of x.

```
arccos(1/2)
```

 $\frac{1}{3}\pi$ 

### $\operatorname{arccosh}(x)$

Returns the arc hyperbolic cosine of x.

## $\arcsin(x)$

Returns the arc sine of x.

```
arcsin(1/2)
```

```
\frac{1}{6}\pi
```

### $\operatorname{arcsinh}(x)$

Returns the arc hyperbolic sine of x.

## $\arctan(y, x)$

Returns the arc tangent of y over x. If x is omitted then x = 1 is used.

```
arctan(1,0)
```

 $\frac{1}{2}\pi$ 

### $\operatorname{arctanh}(x)$

Returns the arc hyperbolic tangent of x.

## arg(z)

Returns the angle of complex z.

```
arg(2 - 3i)
```

 $\arctan(-3,2)$ 

## binding(s)

The result of evaluating a symbol can differ from the symbol's binding. For example, the result may be expanded. The binding function returns the actual binding of a symbol.

```
p = quote((x + 1)^2)
p
p = x^2 + 2x + 1
binding(p)
(x + 1)^2
```

## $\mathbf{ceiling}(x)$

Returns the smallest integer greater than or equal to x.

```
ceiling(1/2)
```

#### $\mathbf{check}(x)$

If x is true (nonzero) then continue, else stop. Expression x can include the relational operators =, ==, <, <=, >, >=. Use the not function to test for inequality.

```
A = \exp(i pi)

B = -1

check(A == B) -- stop here if A not equal to B
```

## **choose**(n, k)

Returns the binomial coefficient n choose k.

```
choose(52,5) -- number of poker hands 2598960
```

### circexp(x)

Returns expression x with circular and hyperbolic functions converted to exponentials.

```
circexp(cos(x) + i sin(x))
exp(ix)
```

#### clear

Clears all symbol definitions.

## $\operatorname{clock}(z)$

Returns complex z in polar form with base of negative 1 instead of e.

```
clock(2 - 3i) 13^{1/2} \, (-1)^{\arctan(-3,2)/\pi}
```

## cofactor(m, i, j)

Returns the cofactor of matrix m for row i and column j.

```
A = ((a,b),(c,d))

cofactor(A,1,2) == adj(A)[2,1]
```

## conj(z)

Returns the complex conjugate of z.

```
conj(2 - 3i) 2 + 3i
```

## $\mathbf{contract}(a, i, j)$

Returns tensor a summed over indices i and j. If i and j are omitted then 1 and 2 are used. The expression contract(m) computes the trace of matrix m.

```
A = ((a,b),(c,d))
contract(A)
a + d
```

## $\cos(x)$

Returns the cosine of x.

cos(pi/4)

$$\frac{1}{2^{1/2}}$$

## $\cosh(x)$

Returns the hyperbolic cosine of x.

```
circexp(cosh(x))
```

$$\frac{1}{2}\exp(-x) + \frac{1}{2}\exp(x)$$

## $\mathbf{cross}(u,v)$

Returns the cross product of vectors u and v.

## $\operatorname{curl}(v)$

Returns the curl of vector v with respect to symbols  $\mathbf{x}$ ,  $\mathbf{y}$ , and  $\mathbf{z}$ .

```
\mathbf{d}(f, x, \ldots)
```

Returns the partial derivative of f with respect to x and any additional arguments.

```
d(\sin(x),x)
```

 $\cos(x)$ 

Multiderivatives are computed by extending the argument list.

```
d(\sin(x),x,x)
```

 $-\sin(x)$ 

A numeric argument n computes the nth derivative with respect to the previous symbol.

```
d(\sin(x y),x,2,y,2)
```

```
x^2y^2\sin(xy) - 4xy\cos(xy) - 2\sin(xy)
```

Argument f can be a tensor of any rank. Argument x can be a vector. When x is a vector the result is the gradient of f.

```
F = (f(),g(),h())
X = (x,y,z)
d(F,X)
```

```
\begin{bmatrix} \operatorname{d}(f(),x) & \operatorname{d}(f(),y) & \operatorname{d}(f(),z) \\ \operatorname{d}(g(),x) & \operatorname{d}(g(),y) & \operatorname{d}(g(),z) \\ \operatorname{d}(h(),x) & \operatorname{d}(h(),y) & \operatorname{d}(h(),z) \end{bmatrix}
```

Symbol d can be used as a variable name. Doing so does not conflict with function d.

Symbol d can be redefined as a different function. The function derivative, a synonym for d, can be used to obtain a partial derivative.

```
\mathbf{defint}(f, x, a, b)
```

Returns the definite integral of f with respect to x evaluated from a to b. The argument list can be extended for multiple integrals as shown in the following example.

```
f = (1 + cos(theta)^2) sin(theta)

-- integrate over theta then over phi

defint(f, theta, 0, pi, phi, 0, 2 pi)

\frac{16}{3}\pi
```

### denominator(x)

Returns the denominator of expression x.

```
denominator(a/b)
b
```

## det(m)

Returns the determinant of matrix m.

```
A = ((a,b),(c,d))
det(A)
ad - bc
```

### dim(a, n)

Returns the dimension of the nth index of tensor a. Index numbering starts with 1.

```
A = ((1,2),(3,4),(5,6))

\dim(A,1)
```

## div(v)

Returns the divergence of vector v with respect to symbols x, y, and z.

```
do(a, b, \ldots)
```

Evaluates each argument from left to right. Returns the result of the final argument.

```
do(A=1,B=2,A+B)
```

### $dot(a, b, \ldots)$

Returns the dot product of vectors, matrices, and tensors. Also known as the matrix product. Arguments are evaluated from right to left. The following example solves for X in AX = B.

```
A = ((1,2),(3,4))

B = (5,6)

X = dot(inv(A),B)

X
\begin{bmatrix} -4 \\ \frac{9}{2} \end{bmatrix}
```

### eigenvec(m)

Returns eigenvectors for matrix m. Matrix m is required to be numerical, real, and symmetric. The return value is a matrix with each column an eigenvector. Eigenvalues are obtained as shown.

```
A = ((1,2,3),(2,6,4),(3,4,5))
Q = eigenvec(A)
D = dot(transpose(Q),A,Q) -- eigenvalues on the diagonal of D
dot(Q,D,transpose(Q))

[1 2 3]
2 6 4
3 4 5]
```

### eval(f, x, a)

Returns expression f evaluated at x equals a. The argument list can be extended as shown.

```
f = sqrt(x^2 + y^2)
eval(f,x,3,y,4) -- evaluate f at x=3 and y=4
```

The eval function can be used for substitution. In the following example, eval is used to replace x with cos(theta).

```
-- associated legendre of cos theta P(1,m) = \operatorname{test}(m < 0, (-1)^m (1+m)! / (1-m)! P(1,-m), \\ 1 / (2^1 1!) \sin(\operatorname{theta})^m * \\ \operatorname{eval}(\operatorname{d}((x^2 - 1)^1,x,1+m),x,\cos(\operatorname{theta}))) P(2,-1) \\ -\frac{1}{2}\cos(\theta)\sin(\theta) \exp(x) Returns the exponential of x.
```

-1

exp(i pi)

## $\exp\cos(z)$

Returns the cosine of z in exponential form.

#### expcos(z)

$$\frac{1}{2}\exp(iz) + \frac{1}{2}\exp(-iz)$$

### expcosh(z)

Returns the hyperbolic cosine of z in exponential form.

#### expcosh(z)

$$\frac{1}{2}\exp(-z) + \frac{1}{2}\exp(z)$$

### expsin(z)

Returns the sine of z in exponential form.

#### expsin(z)

$$-\frac{1}{2}i\exp(iz) + \frac{1}{2}i\exp(-iz)$$

## expsinh(z)

Returns the hyperbolic sine of z in exponential form.

#### expsinh(z)

$$-\frac{1}{2}\exp(-z) + \frac{1}{2}\exp(z)$$

### exptan(z)

Returns the tangent of z in exponential form.

#### exptan(z)

$$\frac{i}{\exp(2iz)+1} - \frac{i\exp(2iz)}{\exp(2iz)+1}$$

## exptanh(z)

Returns the hyperbolic tangent of z in exponential form.

#### exptanh(z)

$$-\frac{1}{\exp(2z) + 1} + \frac{\exp(2z)}{\exp(2z) + 1}$$

#### factorial(n)

Returns the factorial of n. The expression n! can also be used.

20!

2432902008176640000

### float(x)

Returns expression x with rational numbers and integers converted to floating point values. The symbol pi and the natural number are also converted.

```
float(212^17)
```

# $3.52947 \times 10^{39}$

floor(x)

Returns the largest integer less than or equal to x.

```
floor(1/2)
```

0

$$for(i, j, k, a, b, \ldots)$$

For i equals j through k evaluate a, b, etc.

```
for(k,1,3,A=k,print(A))
```

A = 1

A=2

A = 3

Note: The original value of i is restored after for completes. If symbol i is used for index variable i then the imaginary unit is overridden in the scope of for.

## grad(f)

Returns the gradient d(f,(x,y,z)).

#### grad(f())

$$\begin{bmatrix} d(f(), x) \\ d(f(), y) \\ d(f(), z) \end{bmatrix}$$

#### hadamard(a, b, ...)

Returns the Hadamard (element-wise) product.

```
X = (a,b,c)
hadamard(X,X)
\begin{bmatrix} a^2 \\ b^2 \\ c^2 \end{bmatrix}
```

#### i

Symbol i is initialized to the imaginary unit  $\sqrt{-1}$ .

```
exp(i pi)
-1
```

Note: It is ok to clear or redefine i and use the symbol for something else.

### imag(z)

Returns the imaginary part of complex z.

```
imag(2 - 3i)
-3
```

## infixform(x)

Converts expression x to a string and returns the result.

```
p = (x + 1)^2
infixform(p)
x^2 + 2x + 1
```

## $inner(a, b, \ldots)$

Returns the inner product of vectors, matrices, and tensors. Also known as the matrix product.

```
A = ((a,b),(c,d))
B = (x,y)
inner(A,B)
\begin{bmatrix} ax + by \\ cx + dy \end{bmatrix}
```

Note: inner and dot are the same function.

## integral(f, x)

Returns the integral of f with respect to x.

```
integral(x^2, x)
\frac{1}{3}x^3
```

## inv(m)

Returns the inverse of matrix m.

$$A = ((1,2),(3,4))$$
  
inv(A)  
 $\begin{bmatrix} -2 & 1 \end{bmatrix}$ 

#### i

Set j=sqrt(-1) to use j for the imaginary unit instead of i.

```
j = sqrt(-1)
1/sqrt(-1)
-j
```

## kronecker(a, b, ...)

Returns the Kronecker product of vectors and matrices.

```
A = ((1,2),(3,4))

B = ((a,b),(c,d))

kronecker(A,B)
```

$$\begin{bmatrix} a & b & 2a & 2b \\ c & d & 2c & 2d \\ 3a & 3b & 4a & 4b \\ 3c & 3d & 3c & 4d \end{bmatrix}$$

#### last

The result of the previous calculation is stored in last.

```
212^17
```

3529471145760275132301897342055866171392

```
last^(1/17)
```

212

Symbol last is an implied argument when a function has no argument list.

#### 212^17

3529471145760275132301897342055866171392

#### float

 $3.52947 \times 10^{39}$ 

## $\log(x)$

Returns the natural logarithm of x.

```
log(x^y)
```

 $y \log(x)$ 

## mag(z)

Returns the magnitude of complex z. Function mag treats undefined symbols as real while abs does not.

```
mag(x + i y)
```

$$(x^2+y^2)^{1/2}$$

## minor(m, i, j)

Returns the minor of matrix m for row i and column j.

```
A = ((1,2,3),(4,5,6),(7,8,9))
minor(A,1,1) == det(minormatrix(A,1,1))
```

#### minormatrix(m, i, j)

Returns a copy of matrix m with row i and column j removed.

```
A = ((1,2,3),(4,5,6),(7,8,9))
minormatrix(A,1,1)
\begin{bmatrix} 5 & 6 \\ 8 & 9 \end{bmatrix}
```

#### noexpand(x)

Evaluates expression x without expanding products of sums.

```
noexpand((x + 1)^2 / (x + 1))

x + 1

not(x)

Returns 0 if x is true (nonzero). Returns 1 otherwise.
```

not(1=1)

0

## $\mathbf{nroots}(p, x)$

 $p = x^5 - 1$ 

Returns the approximate roots of polynomials with real or complex coefficients. Multiple roots are returned as a vector.

```
 \begin{array}{c} {\rm nroots(p,x)} \\ \\ {1 \atop -0.809017 + 0.587785 \, i} \\ {-0.809017 - 0.587785 \, i} \\ {0.309017 + 0.951057 \, i} \end{array}
```

0.309017 - 0.951057 i

## numerator(x)

Returns the numerator of expression x.

```
numerator(a/b)
```

```
or(a, b, \ldots)
```

Returns 1 if at least one argument is true (nonzero). Returns 0 otherwise.

```
or(1=1,2=2)
```

1

## $\mathbf{outer}(a,b,\ldots)$

Returns the outer product of vectors, matrices, and tensors.

```
A = (a,b,c)
B = (x,y,z)
outer(A,B)
ax ay az
```

$$\begin{bmatrix} ax & ay & az \\ bx & by & bz \\ cx & cy & cz \end{bmatrix}$$

#### pi

Symbol for  $\pi$ .

-1

## polar(z)

Returns complex z in polar form.

```
\begin{aligned} & \texttt{polar(x - i y)} \\ & (x^2 + y^2)^{1/2} \exp(i \arctan(-y, x)) \end{aligned}
```

#### power

Use ^ to raise something to a power. Use parentheses for negative powers.

$$x^{(-2)}$$

$$\frac{1}{2}$$

#### print(a, b, ...)

Evaluate expressions and print the results. Useful for printing from inside a for loop.

```
for(j,1,3,print(j))

j = 1
j = 2
j = 3
```

## product(i, j, k, f)

For i equals j through k evaluate f. Returns the product of all f.

```
product(j,1,3,x + j)
x^3 + 6x^2 + 11x + 6
```

The original value of i is restored after product completes. If symbol i is used for index variable i then the imaginary unit is overridden in the scope of product.

## product(y)

Returns the product of components of y.

```
y = (1,2,3,4)
product(y)
```

24

## quote(x)

Returns expression x without evaluating it first.

```
quote((x + 1)^2)
(x+1)^2
```

## rank(a)

Returns the number of indices that tensor a has.

```
A = ((a,b),(c,d))
rank(A)
```

### rationalize(x)

Returns expression x with everything over a common denominator.

```
rationalize(1/a + 1/b + 1/2)\frac{2a + ab + 2b}{2ab}
```

Note: rationalize returns an unexpanded expression. If the result is assigned to a symbol, evaluating the symbol will expand the result. Use binding to retrieve the unexpanded expression.

```
f = rationalize(1/a + 1/b + 1/2)
binding(f)
\frac{2a + ab + 2b}{2ab}
```

#### real(z)

Returns the real part of complex z.

```
real(2 - 3i)
2
```

#### rect(z)

Returns complex z in rectangular form.

```
rect(exp(i x))
cos(x) + i sin(x)
```

## $\mathbf{roots}(p, x)$

Returns the rational roots of a polynomial. Multiple roots are returned as a vector.

```
p = (x + 1) (x - 2)
roots(p,x)
\begin{bmatrix} -1 \\ 2 \end{bmatrix}
```

If no roots are found then nil is returned. A nil result is not printed so the following example uses infixform to print nil as a string.

```
p = x^2 + 1
infixform(roots(p,x))
nil
```

## rotate(u, s, k, ...)

Rotates vector u and returns the result. Vector u is required to have  $2^n$  elements where n is an integer from 1 to 15. Arguments  $s, k, \ldots$  are a sequence of rotation codes where s is an upper case letter and k is a qubit number from 0 to n-1. Rotations are evaluated from left to right. See section 3 for a list of rotation codes.

```
psi = (1,0,0,0)
rotate(psi,H,0)
```

```
\frac{1}{2^{1/2}}

\frac{1}{2^{1/2}}

0
```

### run(x)

Run script x where x evaluates to a filename string. Useful for importing function libraries.

```
run("EVA2.txt")
```

For Eigenmath installed from the Mac App Store, run files need to be put in the directory ~/Library/Containers/eigenmath/Data/

### simplify(x)

Returns expression x in a simpler form.

```
simplify(\sin(x)^2 + \cos(x)^2)
```

## sin(x)

Returns the sine of x.

```
sin(pi/4)
```

```
\frac{1}{2^{1/2}}
```

#### sinh(x)

Returns the hyperbolic sine of x.

#### circexp(sinh(x))

$$-\frac{1}{2}\exp(-x) + \frac{1}{2}\exp(x)$$

## $\mathbf{sqrt}(x)$

Returns the square root of x.

#### sqrt(10!)

 $720 \ 7^{1/2}$ 

#### stop

In a script, it does what it says.

#### sum(i, j, k, f)

For i equals j through k evaluate f. Returns the sum of all f.

$$sum(j,1,5,x^{j})$$

$$x^5 + x^4 + x^3 + x^2 + x$$

The original value of i is restored after sum completes. If symbol i is used for index variable i then the imaginary unit is overridden in the scope of sum.

## sum(y)

Returns the sum of components of y.

```
y = (1,2,3,4)
sum(y)
```

10

## tan(x)

Returns the tangent of x.

```
simplify(tan(x) - sin(x)/cos(x))
```

### tanh(x)

Returns the hyperbolic tangent of x.

#### circexp(tanh(x))

$$-\frac{1}{\exp(2x) + 1} + \frac{\exp(2x)}{\exp(2x) + 1}$$

$$\mathbf{test}(a, b, c, d, \ldots)$$

If argument a is true (nonzero) then b is returned, else if c is true then d is returned, etc. If the number of arguments is odd then the final argument is returned if all else fails. Expressions can include the relational operators =, ==, <, <=, >, >=. Use the not function to test for inequality. (The equality operator == is available for contexts in which = is the assignment operator.)

```
A = 1
B = 1
test(A=B,"yes","no")
yes
```

#### trace

Set trace=1 in a script to print the script as it is evaluated. Useful for debugging.

```
trace = 1
```

Note: The contract function is used to obtain the trace of a matrix.

## transpose(a, i, j)

Returns the transpose of tensor a with respect to indices i and j. If i and j are omitted then 1 and 2 are used. Hence a matrix can be transposed with a single argument.

$$A = ((a,b),(c,d))$$
  
transpose(A)

$$\begin{bmatrix} a & c \\ b & d \end{bmatrix}$$

Note: The argument list can be extended for multiple transpose operations. Arguments are evaluated from left to right. For example, transpose(A,1,2,2,3) is equivalent to transpose(transpose(A,1,2),2,3)

#### tty

Set tty=1 to show results in string format. Set tty=0 to turn off. Can be useful when displayed results exceed window size.

```
tty = 1
(x + 1)^2
x^2 + 2 x + 1
```

## unit(n)

Returns an n by n identity matrix.

#### unit(3)

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{zero}(i, j, \ldots)$$

Returns a null tensor with dimensions i, j, etc. Useful for creating a tensor and then setting component values.

$$A = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$
