# Syntax

| Math   | Eigen math     | Comment                              |
|--|----------------|--------------------------------------|
| a = b  | a == b         | test for equality                    |
| -a   | -a             | negation                             |
| a + b  | a+b            | addition                             |
| a - b  | a-b            | subtraction                          |
| ab   | a b            | $multiplication, \ also \ {\tt a*b}$ |
| $\frac{a}{b}$                                  | a/b            | division                             |
| $\frac{a}{bc}$                                 | a/b/c          | division is left-associative         |
| $a^2$  | a^2            | power                                |
| $\sqrt{a}$                                     | sqrt(a)        | square root, also a^(1/2)            |
| a(b+c)   | a (b+c)        | space is required                    |
| f(a)   | f(a)           | function                             |
| $\begin{pmatrix} a \\ b \\ c \end{pmatrix}$    | (a,b,c)        | vector                               |
| $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ | ((a,b),(c,d))  | matrix                               |
| $F^1{}_2$                                      | F[1,2]         | tensor component access              |
|  | "hello, world" | string literal                       |
| $\pi$  | pi             |                                      |
| e  | exp(1)         | $natural\ number$                    |

Arithmetic operators have the expected precedence of multiplication and division before addition and subtraction. Subexpressions in parentheses have highest precedence.

Parentheses are required around negative exponents. For example,

### 10^(-3)

instead of

#### 10^-3

The reason for this is that the binding of the negative sign is not always obvious. For example, consider

#### $x^-1/2$

It is not clear whether the exponent should be -1 or -1/2. Hence the following syntax is required.

#### $x^{(-1/2)}$

In general, parentheses are always required when the exponent is an expression. For example,  $x^1/2$  is evaluated as  $(x^1)/2$  which is probably not the desired result.

## x^1/2

 $\frac{1}{2}x$ 

Using  $x^{(1/2)}$  yields the desired result.

# $x^{(1/2)}$

 $x^{1/2}$
