Rutherford scattering 1

Use the following formula to compute the cross section for Rutherford scattering.

$$\frac{d\sigma}{d\Omega} = \frac{1}{16\pi^2 \varepsilon_0^2} \left(\frac{mQ}{4\pi\hbar^2}\right)^2, \quad Q = \int \exp\left(\frac{i\mathbf{p} \cdot \mathbf{r}}{\hbar}\right) V(\mathbf{r}) d\mathbf{r}^3$$

Convert Q to polar coordinates.

$$Q = \int_0^{2\pi} \int_0^{\pi} \int_0^{\infty} \exp\left(\frac{ipr\cos\theta}{\hbar}\right) V(r,\theta,\phi) r^2 \sin\theta \, dr \, d\theta \, d\phi$$

For Rutherford scattering $V(\mathbf{r})$ is the Coulomb potential.

$$V(\mathbf{r}) = V(r) = -\frac{Ze^2}{r}$$

Substitute the Coulomb potential for $V(r, \theta, \phi)$ and note r^2 becomes r.

$$Q = -Ze^2 \int_0^{2\pi} \int_0^{\pi} \int_0^{\infty} \exp\left(\frac{ipr\cos\theta}{\hbar}\right) r\sin\theta \, dr \, d\theta \, d\phi$$

Integrate over ϕ .

$$Q = -2\pi Z e^2 \int_0^{\pi} \int_0^{\infty} \exp\left(\frac{ipr\cos\theta}{\hbar}\right) r\sin\theta \, dr \, d\theta$$

Change the complex exponential to rectangular form.

$$Q = -2\pi Z e^2 \int_0^{\pi} \int_0^{\infty} \left[\cos \left(\frac{pr \cos \theta}{\hbar} \right) + i \sin \left(\frac{pr \cos \theta}{\hbar} \right) \right] V(r) r \sin \theta \, dr \, d\theta$$

By the integrals

$$\int_0^{\pi} \cos(a\cos(\theta)) \sin\theta \, d\theta = \frac{2\sin a}{a}, \quad \int_0^{\pi} \sin(a\cos(\theta)) \sin\theta \, d\theta = 0$$

we obtain (note r in the integrand is canceled)

$$Q = -\frac{4\pi\hbar Z e^2}{p} \int_0^\infty \sin\left(\frac{pr}{\hbar}\right) dr$$

To solve the integral, multiply the integrand by $\exp(-\epsilon r)$.

$$Q = -\frac{4\pi\hbar Z e^2}{p} \int_0^\infty \sin\left(\frac{pr}{\hbar}\right) \exp(-\epsilon r) dr$$

Convert the integrand to exponential form.

$$Q = -\frac{4\pi\hbar Ze^2}{p} \int_0^\infty \frac{i}{2} \left[\exp\left(-\frac{ipr}{\hbar} - \epsilon r\right) - \exp\left(\frac{ipr}{\hbar} - \epsilon r\right) \right] dr$$

Solve the integral.

$$Q = -\frac{4\pi\hbar Z e^2}{p} \frac{i}{2} \left(\frac{1}{-ip/\hbar - \epsilon} - \frac{1}{ip/\hbar - \epsilon} \right)$$
 (1)

Set $\epsilon = 0$.

$$Q = -\frac{4\pi\hbar Z e^2}{p} \left(-\frac{\hbar}{p} \right)$$

Hence

$$Q = \frac{4\pi\hbar^2 Z e^2}{p^2}$$

Compute the differential cross section.

$$\frac{d\sigma}{d\Omega} = \frac{1}{16\pi^2 \varepsilon_0^2} \left(\frac{mQ}{4\pi\hbar^2}\right)^2 = \frac{1}{16\pi^2 \varepsilon_0^2} \frac{m^2 Z^2 e^4}{p^4}$$
 (2)

Substitute $16\pi^2 \varepsilon_0^2 \alpha^2 (\hbar c)^2$ for e^4 .

$$\frac{d\sigma}{d\Omega} = \frac{m^2 Z^2 \alpha^2 (\hbar c)^2}{p^4}$$

Symbol p is momentum transfer $|\mathbf{p}_i| - |\mathbf{p}_f|$ such that

$$p^2 = 2mE(\cos\theta - 1)$$

Hence

$$\frac{d\sigma}{d\Omega} = \frac{Z^2 \alpha^2 (\hbar c)^2}{4E^2 (\cos \theta - 1)^2} \tag{3}$$

Noting that

$$4\sin^4\frac{\theta}{2} = (\cos(\theta) - 1)^2$$

we also have

$$\frac{d\sigma}{d\Omega} = \frac{Z^2 \alpha^2 (\hbar c)^2}{16E^2 \sin^4(\theta/2)}$$

Experimental data

The following data is from Geiger and Marsden's 1913 paper (y is the number of scattering events).

$$\begin{array}{ccc} \theta & y \\ 150 & 22.2 \\ 135 & 27.4 \\ 120 & 33.0 \\ 105 & 47.3 \\ 75 & 136 \\ 60 & 320 \\ 45 & 989 \\ 37.5 & 1760 \\ 30 & 5260 \\ 22.5 & 20300 \\ 15 & 105400 \\ \end{array}$$

Let

$$x_i = \frac{1}{\sin^4(\theta_i/2)}$$

The scattering probability for angle θ_i is x_i normalized by $\sum x = 4529$.

$$\Pr(\theta_i) = \frac{x_i}{4529}$$

Predicted values \hat{y}_i are $\Pr(\theta_i)$ times total scattering events $\sum y = 134295$.

$$\hat{y}_i = \Pr(\theta_i) \times 134295$$

The following table shows the predicted values \hat{y} .

| θ | y | \hat{y} |
|----------|--------|-----------|
| 150 | 22.2 | 34.1 |
| 135 | 27.4 | 40.7 |
| 120 | 33.0 | 52.7 |
| 105 | 47.3 | 74.9 |
| 75 | 136 | 216 |
| 60 | 320 | 474 |
| 45 | 989 | 1383 |
| 37.5 | 1760 | 2778 |
| 30 | 5260 | 6608 |
| 22.5 | 20300 | 20471 |
| 15 | 105400 | 102162 |

The coefficient of determination \mathbb{R}^2 measures how well predicted values fit the data.

$$R^{2} = 1 - \frac{\sum_{i} (y_{i} - \hat{y}_{i})^{2}}{\sum_{i} (y_{i} - \bar{y})^{2}} = 0.999$$

The result indicates that x explains 99.9% of the variance in the data.
