Compton scattering

Compton scattering is the interaction $e^- + \gamma \rightarrow e^- + \gamma$.

In the center-of-mass frame we have the following momentum vectors where $E = \sqrt{\omega^2 + m^2}$.

$$p_{1} = \begin{pmatrix} \omega \\ 0 \\ 0 \\ \omega \end{pmatrix} \qquad p_{2} = \begin{pmatrix} E \\ 0 \\ 0 \\ -\omega \end{pmatrix} \qquad p_{3} = \begin{pmatrix} \omega \\ \omega \sin \theta \cos \phi \\ \omega \sin \theta \sin \phi \\ \omega \cos \theta \end{pmatrix} \qquad p_{4} = \begin{pmatrix} E \\ -\omega \sin \theta \cos \phi \\ -\omega \sin \theta \sin \phi \\ -\omega \cos \theta \end{pmatrix}$$

outbound photon

Spinors for the inbound electron.

$$u_{21} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} E+m\\0\\-\omega\\0 \end{pmatrix} \qquad u_{22} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0\\E+m\\0\\\omega \end{pmatrix}$$
inbound electron spin up inbound electron spin down

Spinors for the outbound electron.

$$u_{41} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} E+m \\ 0 \\ p_{4z} \\ p_{4x} + ip_{4y} \end{pmatrix} \qquad u_{42} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0 \\ E+m \\ p_{4x} - ip_{4y} \\ -p_{4z} \end{pmatrix}$$
 outbound electron spin up outbound electron spin down

The scattering amplitude $\mathcal{M}_{ab}^{\mu\nu}$ for spin ab and polarization $\mu\nu$ is

where

$$\mathcal{M}_{1ab}^{\mu\nu} = \frac{\bar{u}_{4b}(-ie\gamma^{\mu})(\not q_1 + m)(-ie\gamma^{\nu})u_{2a}}{s - m^2}$$
$$\mathcal{M}_{2ab}^{\nu\mu} = \frac{\bar{u}_{4b}(-ie\gamma^{\nu})(\not q_2 + m)(-ie\gamma^{\mu})u_{2a}}{u - m^2}$$

Matrices ${\not\!q}_1$ and ${\not\!q}_2$ represent momentum transfer.

$$\begin{aligned}
&\not q_1 = (p_1 + p_2)^{\alpha} g_{\alpha\beta} \gamma^{\beta} \\
&\not q_2 = (p_4 - p_1)^{\alpha} g_{\alpha\beta} \gamma^{\beta}
\end{aligned}$$

Scalars s and u are Mandelstam variables.

$$s = (p_1 + p_2)^2$$
$$u = (p_1 - p_4)^2$$

In component form (note that indices μ and ν are interchanged for \mathcal{M}_{2ab})

$$\mathcal{M}_{1ab}^{\mu\nu} = \frac{(\bar{u}_{4b})_{\alpha}(-ie\gamma^{\mu\alpha}{}_{\beta})(\not q_1 + m)^{\beta}{}_{\rho}(-ie\gamma^{\nu\rho}{}_{\sigma})(u_{2a})^{\sigma}}{s - m^2}$$

$$\mathcal{M}_{2ab}^{\nu\nu} = \frac{(\bar{u}_{4b})_{\alpha}(-ie\gamma^{\nu\alpha}{}_{\beta})(\not q_2 + m)^{\beta}{}_{\rho}(-ie\gamma^{\mu\rho}{}_{\sigma})(u_{2a})^{\sigma}}{u - m^2}$$

The expected probability density $\langle |\mathcal{M}|^2 \rangle$ is the average over spin and polarization states.

$$\langle |\mathcal{M}|^2 \rangle = \frac{1}{4} \sum_{a,b} \sum_{\mu,\nu} \left| \mathcal{M}_{ab}^{\mu\nu} \right|^2$$

Summing over μ and ν requires $g_{\mu\nu}$ to lower indices.

$$\langle |\mathcal{M}|^2 \rangle = \frac{1}{4} \sum_{a,b} \mathcal{M}_{ab}^{\mu\nu} \left(g_{\mu\alpha} \mathcal{M}_{ab}^{\alpha\beta} g_{\beta\nu} \right)^*$$

Substitute $\mathcal{M}_{1ab} + \mathcal{M}_{2ab}$ for \mathcal{M}_{ab} .

$$\langle |\mathcal{M}|^2 \rangle = \frac{1}{4} \sum_{a,b} \left[\mathcal{M}_{1ab}^{\mu\nu} \left(g_{\mu\alpha} \mathcal{M}_{1ab}^{\alpha\beta} g_{\beta\nu} \right)^* + \mathcal{M}_{1ab}^{\mu\nu} \left(g_{\nu\alpha} \mathcal{M}_{2ab}^{\alpha\beta} g_{\beta\mu} \right)^* \right. \\ \left. + \mathcal{M}_{2ab}^{\nu\mu} \left(g_{\mu\alpha} \mathcal{M}_{1ab}^{\alpha\beta} g_{\beta\nu} \right)^* + \mathcal{M}_{2ab}^{\nu\mu} \left(g_{\nu\alpha} \mathcal{M}_{2ab}^{\alpha\beta} g_{\beta\mu} \right)^* \right]$$

The Casimir trick uses matrix arithmetic to sum over spin and polarization states.

$$\langle |\mathcal{M}|^2 \rangle = \frac{e^4}{4} \left(\frac{f_{11}}{(s-m^2)^2} + \frac{2f_{12}}{(s-m^2)(u-m^2)} + \frac{f_{22}}{(u-m^2)^2} \right) \tag{1}$$

where

$$f_{11} = \operatorname{Tr}\left((\not p_2 + m)\gamma^{\mu}(\not q_1 + m)\gamma^{\nu}(\not p_4 + m)\gamma_{\nu}(\not q_1 + m)\gamma_{\mu}\right)$$

$$f_{12} = \operatorname{Tr}\left((\not p_2 + m)\gamma^{\mu}(\not q_2 + m)\gamma^{\nu}(\not p_4 + m)\gamma_{\mu}(\not q_1 + m)\gamma_{\nu}\right)$$

$$f_{22} = \operatorname{Tr}\left((\not p_2 + m)\gamma^{\mu}(\not q_2 + m)\gamma^{\nu}(\not p_4 + m)\gamma_{\nu}(\not q_2 + m)\gamma_{\mu}\right)$$

The following formulas are equivalent to the Casimir trick. (Recall that $a \cdot b = a^{\mu}g_{\mu\nu}b^{\nu}$)

$$f_{11} = 32(p_1 \cdot p_2)(p_1 \cdot p_4) + 64m^2(p_1 \cdot p_2) - 32m^2(p_1 \cdot p_3) - 32m^2(p_1 \cdot p_4) + 32m^4$$

$$f_{12} = 16m^2(p_1 \cdot p_2) - 16m^2(p_1 \cdot p_4) + 32m^4$$

$$f_{22} = 32(p_1 \cdot p_2)(p_1 \cdot p_4) + 32m^2(p_1 \cdot p_2) - 32m^2(p_1 \cdot p_3) - 64m^2(p_1 \cdot p_4) + 32m^4$$

In Mandelstam variables

$$f_{11} = -8su + 24sm^{2} + 8um^{2} + 8m^{4}$$

$$f_{12} = 8sm^{2} + 8um^{2} + 16m^{4}$$

$$f_{22} = -8su + 8sm^{2} + 24um^{2} + 8m^{4}$$
(2)

Compton scattering experiments are typically done in the lab frame where the electron is at rest. Define Lorentz boost Λ for transforming momentum vectors to the lab frame.

$$\Lambda = \begin{pmatrix} E/m & 0 & 0 & \omega/m \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ \omega/m & 0 & 0 & E/m \end{pmatrix}$$

The electron is at rest in the lab frame.

$$\Lambda p_2 = \begin{pmatrix} m \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Mandelstam variables are invariant under a boost.

$$s = (p_1 + p_2)^2 = (\Lambda p_1 + \Lambda p_2)^2$$

$$t = (p_1 - p_3)^2 = (\Lambda p_1 - \Lambda p_3)^2$$

$$u = (p_1 - p_4)^2 = (\Lambda p_1 - \Lambda p_4)^2$$

In the lab frame, let ω_L be the angular frequency of the incident photon and let ω_L' be the angular frequency of the scattered photon.

$$\omega_L = \Lambda p_1 \cdot \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \frac{\omega^2}{m} + \frac{\omega E}{m}$$

$$\omega_L' = \Lambda p_3 \cdot \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \frac{\omega^2 \cos \theta}{m} + \frac{\omega E}{m}$$

It can be shown that

$$s = m^{2} + 2m\omega_{L}$$

$$t = 2m(\omega'_{L} - \omega_{L})$$

$$u = m^{2} - 2m\omega'_{L}$$
(3)

Then by (1), (2), and (3) we have

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} + \left(\frac{m}{\omega_L} - \frac{m}{\omega_L'} + 1 \right)^2 - 1 \right)$$

Lab scattering angle θ_L is given by the Compton equation

$$\cos \theta_L = \frac{m}{\omega_L} - \frac{m}{\omega_L'} + 1$$

Hence

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} + \cos^2 \theta_L - 1 \right)$$
$$= 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} - \sin^2 \theta_L \right)$$

Cross section

Now that we have derived $\langle |\mathcal{M}|^2 \rangle$ we can investigate the angular distribution of scattered photons. For simplicity let us drop the L subscript from lab variables. From now on the symbols ω , ω' , and θ will be lab frame variables.

The differential cross section is

$$\frac{d\sigma}{d\Omega} = \frac{1}{4(4\pi\varepsilon_0)^2 s} \left(\frac{\omega'}{\omega}\right)^2 \langle |\mathcal{M}|^2 \rangle$$

where

$$s = m^2 + 2m\omega = (mc^2)^2 + 2(mc^2)(\hbar\omega)$$

and ω' is given by the Compton equation

$$\omega' = \frac{\omega}{1 + \frac{\hbar\omega}{mc^2}(1 - \cos\theta)}$$

For the lab frame we have

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2 \theta \right)$$

Hence in the lab frame

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{2(4\pi\varepsilon_0)^2 s} \left(\frac{\omega'}{\omega}\right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta\right)$$

Noting that

$$e^2 = 4\pi\varepsilon_0 \alpha \hbar c$$

we have

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2 (\hbar c)^2}{2s} \left(\frac{\omega'}{\omega}\right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2 \theta\right)$$

Noting that

$$d\Omega = \sin\theta \, d\theta \, d\phi$$

we also have

$$d\sigma = \frac{\alpha^2 (\hbar c)^2}{2s} \left(\frac{\omega'}{\omega}\right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta\right) \sin\theta \, d\theta \, d\phi$$

Let $S(\theta_1, \theta_2)$ be the following integral of $d\sigma$.

$$S(\theta_1, \theta_2) = \int_0^{2\pi} \int_{\theta_1}^{\theta_2} d\sigma$$

The solution is

$$S(\theta_1, \theta_2) = \frac{\pi \alpha^2 (\hbar c)^2}{s} [I(\theta_2) - I(\theta_1)]$$

where

$$I(\theta) = -\frac{\cos \theta}{R^2} + \log(1 + R(1 - \cos \theta)) \left(\frac{1}{R} - \frac{2}{R^2} - \frac{2}{R^3}\right) - \frac{1}{2R(1 + R(1 - \cos \theta))^2} + \frac{1}{1 + R(1 - \cos \theta)} \left(-\frac{2}{R^2} - \frac{1}{R^3}\right)$$

and

$$R = \frac{\hbar\omega}{mc^2}$$

The cumulative distribution function is

$$F(\theta) = \frac{S(0,\theta)}{S(0,\pi)} = \frac{I(\theta) - I(0)}{I(\pi) - I(0)}, \quad 0 \le \theta \le \pi$$

The probability of observing scattering events in the interval θ_1 to θ_2 is

$$P(\theta_1 < \theta \le \theta_2) = F(\theta_2) - F(\theta_1)$$

The probability density function is

$$f(\theta) = \frac{dF(\theta)}{d\theta} = \frac{1}{I(\pi) - I(0)} \left(\frac{\omega'}{\omega}\right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta\right) \sin\theta$$

Thomson scattering

For $\hbar\omega \ll mc^2$ we have

$$\omega' = \frac{\omega}{1 + \frac{\hbar\omega}{mc^2} (1 - \cos\theta)} \approx \omega$$

Hence we can use the approximations

$$\omega = \omega'$$
 and $s = (mc^2)^2$

to obtain

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2 \hbar^2}{2m^2 c^2} \left(1 + \cos^2 \theta \right)$$

which is the formula for Thomson scattering.

High energy approximation

For $\omega \gg m$ a useful approximation is to set m=0 and obtain

$$f_{11} = -8su$$
$$f_{12} = 0$$
$$f_{22} = -8su$$

Hence

$$\langle |\mathcal{M}|^2 \rangle = \frac{e^4}{4} \left(\frac{-8su}{s^2} + \frac{-8su}{u^2} \right)$$
$$= 2e^4 \left(-\frac{u}{s} - \frac{s}{u} \right)$$

The Mandelstam variables for m = 0 are

$$s = 4\omega^2$$
$$u = -2\omega^2(\cos\theta + 1)$$

Hence

$$\langle |\mathcal{M}|^2 \rangle = 2e^4 \left(\frac{\cos \theta + 1}{2} + \frac{2}{\cos \theta + 1} \right)$$

In the center of mass frame

$$\frac{d\sigma}{d\Omega} = \frac{\langle |\mathcal{M}|^2 \rangle}{4s(4\pi\epsilon_o)^2} = \frac{e^4}{2s(4\pi\epsilon_o)^2} \left(\frac{\cos\theta + 1}{2} + \frac{2}{\cos\theta + 1} \right)$$

Substitute $e^4 = (4\pi\varepsilon_0\alpha\hbar c)^2$ to obtain

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2}{2s} \left(\frac{\cos \theta + 1}{2} + \frac{2}{\cos \theta + 1} \right) \times (\hbar c)^2$$

It follows that

$$\frac{d\sigma}{d\cos\theta} = 2\pi \frac{d\sigma}{d\Omega} = \frac{\pi\alpha^2}{s} \left(\frac{\cos\theta + 1}{2} + \frac{2}{\cos\theta + 1} \right) \times (\hbar c)^2$$
