# Klein-Nishina formula

The Klein-Nishina formula is the differential cross section for photon-electron scattering.

It is easy to derive the Klein-Nishina formula from Dirac's equation by starting out in the center-of-mass frame and then boosting to the lab frame. In the center-of-mass frame we have the following momentum vectors where $E = \sqrt{\omega^2 + m^2}$.

$$
p_1 = \begin{pmatrix} \omega \\ 0 \\ 0 \\ \omega \end{pmatrix} \quad p_2 = \begin{pmatrix} E \\ 0 \\ 0 \\ -\omega \end{pmatrix} \quad p_3 = \begin{pmatrix} \omega \\ \omega \sin\theta \cos\phi \\ \omega \sin\theta \sin\phi \\ \omega \cos\theta \end{pmatrix} \quad p_4 = \begin{pmatrix} E \\ -\omega \sin\theta \cos\phi \\ -\omega \sin\theta \sin\phi \\ -\omega \cos\theta \end{pmatrix}
$$
$$
\text{inbound photon} \qquad \text{inbound electron} \qquad \text{outbound photon} \qquad \text{outbound electron}
$$

Spinors for the inbound electron.

$$
u_{21} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} E+m \\ 0 \\ -\omega \\ 0 \end{pmatrix} \qquad u_{22} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0 \\ E+m \\ 0 \\ \omega \end{pmatrix}
$$
$$
\text{inbound electron spin up} \qquad\qquad \text{inbound electron spin down}
$$

Spinors for the outbound electron.

$$
u_{41} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} E+m \\ 0 \\ p_{4z} \\ p_{4x}+ip_{4y} \end{pmatrix} \qquad u_{42} = \frac{1}{\sqrt{E+m}} \begin{pmatrix} 0 \\ E+m \\ p_{4x}-ip_{4y} \\ -p_{4z} \end{pmatrix}
$$
$$
\text{outbound electron spin up} \qquad\qquad \text{outbound electron spin down}
$$

The scattering probability amplitude $\mathcal{M}_{ab}$ for spin state ab is

$$
\mathcal{M}_{ba} = \mathcal{M}_{1ab} + \mathcal{M}_{2ab}
$$

where

$$
\mathcal{M}_{1ab} = \frac{\bar{u}_{4b}(-ie\gamma^\mu)(\slashed{p}_1 + m)(-ie\gamma^\nu)u_{2a}}{s - m^2}, \quad \mathcal{M}_{2ab} = \frac{\bar{u}_{4b}(-ie\gamma^\nu)(\slashed{p}_2 + m)(-ie\gamma^\mu)u_{2a}}{u - m^2}
$$

Matrices $\rlap{/}{q}_1$ and $\rlap{/}{q}_2$ represent momentum transfer.

$$\rlap{/}{q}_1 = (p_1 + p_2)^\alpha g_{\alpha\beta}\gamma^\beta$$
$$\rlap{/}{q}_2 = (p_4 - p_1)^\alpha g_{\alpha\beta}\gamma^\beta$$

Scalars s and u are Mandelstam variables.

$$s = (p_1 + p_2)^2$$
$$u = (p_1 - p_4)^2$$

In component form (note that indices μ and ν are interchanged for $\mathcal{M}_{2ab}$)

$$(\mathcal{M}_{1ab})^{\mu\nu} = \frac{(\bar{u}_{4b})_\alpha(-ie\gamma^{\mu\alpha}{}_\beta)(\rlap{/}{q}_1 + m)^\beta{}_\rho(-ie\gamma^{\nu\rho}{}_\sigma)(u_{2a})^\sigma}{s - m^2}$$

$$(\mathcal{M}_{2ab})^{\nu\mu} = \frac{(\bar{u}_{4b})_\alpha(-ie\gamma^{\nu\alpha}{}_\beta)(\rlap{/}{q}_2 + m)^\beta{}_\rho(-ie\gamma^{\mu\rho}{}_\sigma)(u_{2a})^\sigma}{u - m^2}$$

The expected probability density $\langle|\mathcal{M}|^2\rangle$ is the average of spin states.

$$\langle|\mathcal{M}|^2\rangle = \frac{1}{4}\sum_{a=1}^{2}\sum_{b=1}^{2}|\mathcal{M}_{ab}|^2$$

Hence

$$\langle|\mathcal{M}|^2\rangle = \frac{1}{4}\sum_{a=1}^{2}\sum_{b=1}^{2}(\mathcal{M}_{1ab}\mathcal{M}_{1ab}^* + \mathcal{M}_{1ab}\mathcal{M}_{2ab}^* + \mathcal{M}_{2ab}\mathcal{M}_{1ab}^* + \mathcal{M}_{2ab}\mathcal{M}_{2ab}^*)$$

Metric tensor $g_{\mu\nu}$ lowers indices.

$$\mathcal{M}_{1ab}\mathcal{M}_{1ab}^* = (\mathcal{M}_{1ab})^{\mu\nu}(\mathcal{M}_{1ab}^*)_{\mu\nu} = (\mathcal{M}_{1ab})^{\mu\nu}g_{\mu\alpha}(\mathcal{M}_{1ab}^*)^{\alpha\beta}g_{\beta\nu}$$
$$\mathcal{M}_{1ab}\mathcal{M}_{2ab}^* = (\mathcal{M}_{1ab})^{\mu\nu}(\mathcal{M}_{2ab}^*)_{\nu\mu} = (\mathcal{M}_{1ab})^{\mu\nu}g_{\nu\alpha}(\mathcal{M}_{2ab}^*)^{\alpha\beta}g_{\beta\mu}$$
$$\mathcal{M}_{2ab}\mathcal{M}_{2ab}^* = (\mathcal{M}_{2ab})^{\nu\mu}(\mathcal{M}_{2ab}^*)_{\nu\mu} = (\mathcal{M}_{2ab})^{\nu\mu}g_{\nu\alpha}(\mathcal{M}_{2ab}^*)^{\alpha\beta}g_{\beta\mu}$$

The Casimir trick uses matrix arithmetic to sum over spin states.

$$\langle|\mathcal{M}|^2\rangle = \frac{e^4}{4}\left(\frac{f_{11}}{(s-m^2)^2} + \frac{2f_{12}}{(s-m^2)(u-m^2)} + \frac{f_{22}}{(u-m^2)^2}\right) \tag{1}$$

where

$$f_{11} = \mathrm{Tr}\left((\rlap{/}{p}_2 + m)\gamma^\mu(\rlap{/}{q}_1 + m)\gamma^\nu(\rlap{/}{p}_4 + m)\gamma_\nu(\rlap{/}{q}_1 + m)\gamma_\mu\right)$$
$$f_{12} = \mathrm{Tr}\left((\rlap{/}{p}_2 + m)\gamma^\mu(\rlap{/}{q}_2 + m)\gamma^\nu(\rlap{/}{p}_4 + m)\gamma_\mu(\rlap{/}{q}_1 + m)\gamma_\nu\right)$$
$$f_{22} = \mathrm{Tr}\left((\rlap{/}{p}_2 + m)\gamma^\mu(\rlap{/}{q}_2 + m)\gamma^\nu(\rlap{/}{p}_4 + m)\gamma_\nu(\rlap{/}{q}_2 + m)\gamma_\mu\right)$$

The trace operator Tr is the sum of diagonal matrix elements.

The following formulas are equivalent to the Casimir trick. (Recall that $a \cdot b = a^\mu g_{\mu\nu} b^\nu$.)

$$f_{11} = 32(p_1 \cdot p_2)(p_1 \cdot p_4) + 64m^2(p_1 \cdot p_2) - 32m^2(p_1 \cdot p_3) - 32m^2(p_1 \cdot p_4) + 32m^4$$
$$f_{12} = 16m^2(p_1 \cdot p_2) - 16m^2(p_1 \cdot p_4) + 32m^4 \tag{2}$$
$$f_{22} = 32(p_1 \cdot p_2)(p_1 \cdot p_4) + 32m^2(p_1 \cdot p_2) - 32m^2(p_1 \cdot p_3) - 64m^2(p_1 \cdot p_4) + 32m^4$$

In Mandelstam variables

$$f_{11} = -8su + 24sm^2 + 8um^2 + 8m^4$$
$$f_{12} = 8sm^2 + 8um^2 + 16m^4 \tag{3}$$
$$f_{22} = -8su + 8sm^2 + 24um^2 + 8m^4$$

Scattering experiments are typically done in the lab frame. Define Lorentz boost Λ for transforming momentum vectors to the lab frame.

$$\Lambda = \begin{pmatrix} E/m & 0 & 0 & \omega/m \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ \omega/m & 0 & 0 & E/m \end{pmatrix}$$

The electron is at rest in the lab frame.

$$\Lambda p_2 = \begin{pmatrix} m \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

Mandelstam variables are invariant under a boost.

$$s = (p_1 + p_2)^2 = (\Lambda p_1 + \Lambda p_2)^2$$
$$t = (p_1 - p_3)^2 = (\Lambda p_1 - \Lambda p_3)^2 \tag{4}$$
$$u = (p_1 - p_4)^2 = (\Lambda p_1 - \Lambda p_4)^2$$

In the lab frame, let ω_L be the angular frequency of the incident photon and let ω'_L be the angular frequency of the scattered photon.

$$\omega_L = \Lambda p_1 \cdot \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \frac{\omega^2}{m} + \frac{\omega E}{m}$$

$$\omega'_L = \Lambda p_3 \cdot \begin{pmatrix} 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} = \frac{\omega^2 \cos\theta}{m} + \frac{\omega E}{m}$$

It can be shown that

$$s = m^2 + 2m\omega_L$$
$$t = 2m(\omega'_L - \omega_L) \tag{5}$$
$$u = m^2 - 2m\omega'_L$$

3

Then by (1), (3), and (5) we have

$$\langle|\mathcal{M}|^2\rangle = 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} + \left(\frac{m}{\omega_L} - \frac{m}{\omega_L'} + 1 \right)^2 - 1 \right) \qquad (6)$$

Lab scattering angle θ_L is given by the Compton equation

$$\cos\theta_L = \frac{m}{\omega_L} - \frac{m}{\omega_L'} + 1$$

Hence

$$\langle|\mathcal{M}|^2\rangle = 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} + \cos^2\theta_L - 1 \right)$$
$$= 2e^4 \left(\frac{\omega_L}{\omega_L'} + \frac{\omega_L'}{\omega_L} - \sin^2\theta_L \right)$$

Now that we have derived $\langle|\mathcal{M}|^2\rangle$ we can investigate the angular distribution of scattered photons. For simplicity let us drop the L subscript from lab variables. From now on the symbols ω, ω', and θ will be lab frame variables.

The differential cross section is

$$\frac{d\sigma}{d\Omega} = \frac{1}{4(4\pi\varepsilon_0)^2 s} \left(\frac{\omega'}{\omega} \right)^2 \langle|\mathcal{M}|^2\rangle$$

where

$$s = m^2 + 2m\omega = (mc^2)^2 + 2(mc^2)(\hbar\omega)$$

and ω' is given by the Compton equation

$$\omega' = \frac{\omega}{1 + \frac{\hbar\omega}{mc^2}(1 - \cos\theta)}$$

For the lab frame we have

$$\langle|\mathcal{M}|^2\rangle = 2e^4 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta \right)$$

Hence in the lab frame

$$\frac{d\sigma}{d\Omega} = \frac{e^4}{2(4\pi\varepsilon_0)^2 s} \left(\frac{\omega'}{\omega} \right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta \right)$$

Substituting

$$e^2 = 4\pi\varepsilon_0 \alpha\hbar c$$

we have

$$\frac{d\sigma}{d\Omega} = \frac{\alpha^2(\hbar c)^2}{2s} \left(\frac{\omega'}{\omega} \right)^2 \left(\frac{\omega}{\omega'} + \frac{\omega'}{\omega} - \sin^2\theta \right)$$

which is the Klein-Nishina formula.
