

Maxwell equations

Let $\mathbf{E}$ be the electric field

$$\mathbf{E} = E_0 \begin{pmatrix} \sin(kz - \omega t) \\ 0 \\ 0 \end{pmatrix}$$

and $\mathbf{B}$ the magnetic field

$$\mathbf{B} = \frac{E_0}{c} \begin{pmatrix} 0 \\ \sin(kz - \omega t) \\ 0 \end{pmatrix}$$

where $k = \omega/c$. Verify $\mathbf{E}$ and $\mathbf{B}$ are solutions to the free-field Maxwell equations

$$\nabla \cdot \mathbf{E} = 0$$

$$\nabla \cdot \mathbf{B} = 0$$

$$\nabla \times \mathbf{E} = -\frac{\partial}{\partial t} \mathbf{B}$$

$$\nabla \times \mathbf{B} = \frac{1}{c^2} \frac{\partial}{\partial t} \mathbf{E}$$

Electric field $\mathbf{E}$ is measured in Newtons per Coulomb.

$$E_0 = \frac{[\text{N}]}{[\text{C}]}$$

Magnetic field $\mathbf{B}$ is measured in Tesla.

$$\frac{E_0}{c} = \frac{[\text{N}]}{[\text{C}]} \frac{[\text{s}]}{[\text{m}]} = [\text{T}]$$
