

Fermi's golden rule

Find the transition rate $R_{a \rightarrow b}$ for the perturbing Hamiltonian

$$H_1(\mathbf{r}, t) = 2V(\mathbf{r}) \cos(\omega t + \phi)$$

§1

Let $\Psi(\mathbf{r}, t)$ be the following linear combination of two eigenstates.

$$\Psi(\mathbf{r}, t) = c_a(t)\psi_a(\mathbf{r}) \exp(-i\omega_a t) + c_b(t)\psi_b(\mathbf{r}) \exp(-i\omega_b t)$$

We need to solve for $c_b(t)$ to find the transition rate $R_{a \rightarrow b}$.

Start with the Schrodinger equation

$$i\hbar \frac{\partial}{\partial t} \Psi(\mathbf{r}, t) = H_0(\mathbf{r})\Psi(\mathbf{r}, t) + H_1(\mathbf{r}, t)\Psi(\mathbf{r}, t)$$

where

$$H_0(\mathbf{r})\Psi(\mathbf{r}, t) = E_a c_a(t)\psi_a(\mathbf{r}) \exp(-i\omega_a t) + E_b c_b(t)\psi_b(\mathbf{r}) \exp(-i\omega_b t)$$

Evaluate the time derivative.

$$\begin{aligned} i\hbar \frac{\partial}{\partial t} \Psi(\mathbf{r}, t) &= i\hbar \frac{\partial c_a(t)}{\partial t} \psi_a(\mathbf{r}) \exp(-i\omega_a t) + \boxed{\hbar\omega_a c_a(t)\psi_a(\mathbf{r}) \exp(-i\omega_a t)} \\ &\quad + i\hbar \frac{\partial c_b(t)}{\partial t} \psi_b(\mathbf{r}) \exp(-i\omega_b t) + \boxed{\hbar\omega_b c_b(t)\psi_b(\mathbf{r}) \exp(-i\omega_b t)} \\ &= H_0(\mathbf{r})\Psi(\mathbf{r}, t) + H_1(\mathbf{r}, t)\Psi(\mathbf{r}, t) \quad (1) \end{aligned}$$

We have $\hbar\omega_a = E_a$ and $\hbar\omega_b = E_b$ hence the boxed terms cancel with $H_0(\mathbf{r})\Psi(\mathbf{r}, t)$ leaving

$$i\hbar \frac{\partial c_a(t)}{\partial t} \psi_a(\mathbf{r}) \exp(-i\omega_a t) + i\hbar \frac{\partial c_b(t)}{\partial t} \psi_b(\mathbf{r}) \exp(-i\omega_b t) = H_1(\mathbf{r}, t)\Psi(\mathbf{r}, t)$$

Substitute for $H_1(\mathbf{r}, t)$ and $\Psi(\mathbf{r}, t)$.

$$\begin{aligned} i\hbar \frac{\partial c_a(t)}{\partial t} \psi_a(\mathbf{r}) \exp(-i\omega_a t) + i\hbar \frac{\partial c_b(t)}{\partial t} \psi_b(\mathbf{r}) \exp(-i\omega_b t) \\ = 2V(\mathbf{r}) \cos(\omega t + \phi) \left[c_a(t)\psi_a(\mathbf{r}) \exp(-i\omega_a t) + c_b(t)\psi_b(\mathbf{r}) \exp(-i\omega_b t) \right] \end{aligned}$$

Apply an inner product with $\psi_b^*(\mathbf{r})$ to eliminate wave functions.

$$i\hbar \frac{\partial c_b(t)}{\partial t} \exp(-i\omega_b t) = 2 \cos(\omega t + \phi) \left[c_a(t)M_{21} \exp(-i\omega_a t) + c_b(t)M_{22} \exp(-i\omega_b t) \right]$$

Symbols M_{21} and M_{22} are the matrix elements

$$\begin{aligned} M_{21} &= \int \psi_b^*(\mathbf{r}) V(\mathbf{r}) \psi_a(\mathbf{r}) d\mathbf{r} \\ M_{22} &= \int \psi_b^*(\mathbf{r}) V(\mathbf{r}) \psi_b(\mathbf{r}) d\mathbf{r} \end{aligned}$$

Multiply both sides by $\exp(i\omega_b t)$.

$$i\hbar \frac{\partial c_b(t)}{\partial t} = 2 \cos(\omega t + \phi) \left[c_a(t) M_{21} \exp[i(\omega_b - \omega_a)t] + c_b(t) M_{22} \right]$$

For time t near the origin use $c_a(t) \approx 1$ and $c_b(t) \approx 0$ to obtain

$$i\hbar \frac{\partial c_b(t)}{\partial t} = 2 \cos(\omega t + \phi) M_{21} \exp[i(\omega_b - \omega_a)t]$$

Solve for $c_b(t)$ by integrating.

$$c_b(t) = \frac{2M_{21}}{i\hbar} \int_0^t \cos(\omega t' + \phi) \exp[i(\omega_b - \omega_a)t'] dt'$$

In exponential form

$$\begin{aligned} c_b(t) = \frac{M_{21}}{i\hbar} \int_0^t \exp(i\omega t' + \phi) \exp[i(\omega_b - \omega_a)t'] dt' \\ + \frac{M_{21}}{i\hbar} \int_0^t \exp(-i\omega t' - \phi) \exp[i(\omega_b - \omega_a)t'] dt' \end{aligned}$$

The solution is

$$\begin{aligned} c_b(t) = -\frac{M_{21}}{\hbar} \frac{\exp[i(\omega_b - \omega_a + \omega)t] - 1}{\omega_b - \omega_a + \omega} \exp(i\phi) \\ - \frac{M_{21}}{\hbar} \frac{\exp[i(\omega_b - \omega_a - \omega)t] - 1}{\omega_b - \omega_a - \omega} \exp(-i\phi) \quad (2) \end{aligned}$$

For ω such that $\omega \approx \omega_b - \omega_a$ the second term dominates so discard the first term.

$$c_b(t) = -\frac{M_{21}}{\hbar} \frac{\exp[i(\omega_b - \omega_a - \omega)t] - 1}{\omega_b - \omega_a - \omega} \exp(-i\phi)$$

By the identity

$$\exp(ix) - 1 = 2i \sin\left(\frac{x}{2}\right) \exp\left(\frac{ix}{2}\right) \quad (3)$$

we have

$$c_b(t) = -\frac{2iM_{21}}{\hbar} \frac{\sin\left[\frac{1}{2}(\omega_b - \omega_a - \omega)t\right] \exp\left[\frac{1}{2}i(\omega_b - \omega_a - \omega)t\right]}{\omega_b - \omega_a - \omega} \exp(-i\phi)$$

Multiply numerator and denominator by $t/2$ to prepare for sinc function.

$$c_b(t) = -\frac{itM_{21}}{\hbar} \frac{\sin\left[\frac{1}{2}(\omega_b - \omega_a - \omega)t\right] \exp\left[\frac{1}{2}i(\omega_b - \omega_a - \omega)t\right]}{\frac{1}{2}(\omega_b - \omega_a - \omega)t} \exp(-i\phi)$$

Substitute $\text{sinc}(x)$ for $\sin(x)/x$.

$$c_b(t) = -\frac{itM_{21}}{\hbar} \text{sinc}\left[\frac{1}{2}(\omega_b - \omega_a - \omega)t\right] \exp\left[\frac{1}{2}i(\omega_b - \omega_a - \omega)t\right] \exp(-i\phi) \quad (4)$$

§2

Transition density P is the squared magnitude of $c_b(t)$.

$$P = |c_b(t)|^2 = \frac{t^2}{\hbar^2} |M_{21}|^2 \text{sinc}^2 \left[\frac{1}{2}(\omega_b - \omega_a - \omega)t \right] \quad (5)$$

Total density P_{tot} is the integral of P over a small energy band.

$$P_{tot} = \frac{t^2}{\hbar^2} |M_{21}|^2 \int_{E-\epsilon}^{E+\epsilon} \text{sinc}^2 \left[\frac{1}{2}(E'/\hbar - \omega)t \right] \rho(E') dE'$$

The center of the energy band is $E = \hbar(\omega_b - \omega_a)$. Symbol ρ is density of states.

Use the approximation $\rho(E') \approx \rho(\hbar\omega)$ to obtain

$$P_{tot} = \frac{t^2}{\hbar^2} |M_{21}|^2 \rho(\hbar\omega) \int_{E-\epsilon}^{E+\epsilon} \text{sinc}^2 \left[\frac{1}{2}(E'/\hbar - \omega)t \right] dE'$$

Let y be a change of variable such that

$$y = \frac{1}{2}(E'/\hbar - \omega)t$$

From the definition of y we have

$$E' = \frac{2\hbar y}{t} + \hbar\omega$$

hence

$$dE' = \frac{2\hbar}{t} dy$$

The integral limits transform as

$$E \pm \epsilon \rightarrow \frac{1}{2}[(E \pm \epsilon)/\hbar - \omega]t = \frac{Et}{2\hbar} - \frac{\omega t}{2} \pm \frac{\epsilon t}{2\hbar} = \pm \frac{\epsilon t}{2\hbar}$$

After change of variable from E' to y we have (note $t^2/\hbar^2$ is reduced to $t/\hbar$)

$$P_{tot} = \frac{2t}{\hbar} |M_{21}|^2 \rho(\hbar\omega) \int_{-\epsilon t/2\hbar}^{\epsilon t/2\hbar} \text{sinc}^2 y dy$$

Use the approximation

$$\int_{-\epsilon t/2\hbar}^{\epsilon t/2\hbar} \text{sinc}^2 y dy \approx \int_{-\infty}^{\infty} \text{sinc}^2 y dy = \pi$$

to obtain

$$P_{tot} = \frac{2\pi t}{\hbar} |M_{21}|^2 \rho(\hbar\omega)$$

The transition rate is the derivative of P_{tot} .

$$R_{a \rightarrow b} = \frac{d}{dt} P_{tot} = \frac{2\pi}{\hbar} |M_{21}|^2 \rho(\hbar\omega) \quad (6)$$

§3

We started with

$$H_1(\mathbf{r}, t) = 2V(\mathbf{r}) \cos(\omega t + \phi)$$

and obtained Fermi's golden rule (6). Consequently for $H_1(\mathbf{r}, t)$ such that

$$H_1(\mathbf{r}, t) = V(\mathbf{r}) \cos(\omega t + \phi)$$

we would have

$$R_{a \rightarrow b} = \frac{2\pi}{\hbar} \left| \frac{M_{21}}{2} \right|^2 \rho(\hbar\omega)$$
